

[METHOD AND SYSTEM FOR CONSTRUCTION DEBRIS REMOVAL FROM A CONSTRUCTION SITE]

Abstract

A method and system for removing construction debris to greatly reduce cost and improve the aesthetics and removal of hazardous debris from a construction site. The system includes using a pre-determined-sized small steel bin placed at the site that is small enough to be cost effective while at the same time having sufficient storage space for construction debris. A low cost vehicle is used that includes a capture arm that is controlled by a single person for removing trash from the steel bin that is placed in the low cost truck and removed on a periodic basis.
